Agent configuration

Read from the Claude platform on 2026-10-16 20:28 UTC.

Agent

- Name: Deep researcher
- ID: agent_01WedaF6x8gmapUohSFzrcnk (version 1)
- Description: Conducts multi-step web research with source synthesis and citations.

Model

- Model: claude-opus-5-5
- Effort: low
- Speed: standard
- Inference region: default

Tools

- Toolset agent_toolset_20260401 (built-in tools):
- bash: Run shell commands in the session container (enabled, permission: auto)
- read: Read a file (text, images, PDFs, notebooks) (enabled, permission: auto)
- write: Write a file (enabled, permission: auto)
- edit: Replace text in a file (enabled, permission: auto)
- glob: Find files by name pattern (enabled, permission: auto)
- grep: Search file contents with regex (enabled, permission: auto)
- web_fetch: Fetch the content of a URL (enabled, permission: auto)
- web_search: Search the web (enabled, permission: auto)
- MCP servers: 0
- Skills: 0
- Multi-agent: off

System prompt (the agent's standing instructions)

You are a research agent. Given a question or topic:

1. Decompose it into 3-5 concrete sub-questions that, answered together, cover the topic.
2. For each sub-question, run targeted web searches and fetch the most authoritative sources (prefer primary sources, official docs, peer-reviewed work over blog posts and aggregators).
3. Read the sources in full — don't skim. Extract specific claims, data points, and direct quotes with attribution.
4. Synthesize a report that answers the original question. Structure it by sub-question, cite every non-obvious claim inline, and close with a "confidence & gaps" section noting where sources disagreed or where you couldn't find good coverage.
5. Before you send the report, check every citation: replace blog posts, aggregators and encyclopedia pages with the primary source behind them, and name any claim where no stronger source exists.

Be skeptical. If sources conflict, say so and explain which you find more credible and why. Don't paper over uncertainty with confident-sounding prose.

Environment (where the tools run)

- Name: deep-research-env (env_01PHBKTH7GTnCMHTpdAP16ak)
- Type: cloud container
- Network access: unrestricted
- Extra packages: none

Task (the prompt sent for this run)

Find current open job positions for a Senior QA Engineer in Tel Aviv, Israel (or Tel Aviv area / Gush Dan, including hybrid) suitable for a candidate with 15 years of QA experience (manual and automation, E2E testing, worked at Transmit Security, Checkmarx and Kaltura). For each position give: company, job title, location / work model, key requirements, and a direct link to the posting. Prefer postings published in the last 30 days and say the posting date where known. Also summarize which companies are hiring senior QA now, typical salary ranges for senior QA in Tel Aviv, and the most in-demand skills, with sources.

Run

- Session: sesn_011WNvWucsusmmyGK2cP6vh1
- Started: 2026-10-16 20:00 UTC
- Working time: 112 seconds
- Tokens: 629,573 input, 5,687 output
- Web searches: 6
- Cost (list price): $0.88

Report

I found 3 openings that clearly fit a 15-year senior QA profile and 4 more worth a look. The 30-day window was hard to meet: the best-fitting senior roles were posted 5–7 weeks ago or reposted recently. LinkedIn and Glassdoor list about 186–218 QA roles in Tel Aviv, but I couldn't open individual postings there, so this is a checked sample, not the full market.

1. Best fits

Seemplicity: Senior QA Engineer (Data Oriented) (cybersecurity, which matches your Checkmarx/Transmit background)
- Location / work model: Tel Aviv–Yafo. The work model isn't stated in the posting.
- Posted: 2026-08-27, so about 7 weeks old. It was still open in Seemplicity's own hiring system when I checked.
- Role: own quality end to end: defining test strategy, building test plans, and leading quality assurance inside your Scrum team, while staying hands-on with our Python automation framework and using AI tools.
- Must-haves: 5+ years of experience in quality engineering, combining manual and automation work (preferably in cybersecurity), STP/STD documents, 2+ years of hands-on Python experience with pytest and with Playwright - MUST, and strong SQL. It also asks for REST/GraphQL API testing, GitHub Actions and AWS/Azure.
- Link: https://www.comeet.com/jobs/seemplicity/67.00D/senior-qa-engineer-data-oriented/FF.076

DriveNets: QA / E2E Engineer (senior level)
- Location / work model: Ra'anana, hybrid. That's the Sharon area, just outside Gush Dan.
- Posted: Built In showed it as "Reposted 5 days ago" (around 11 October). The original posting date isn't shown.
- Role: Own end-to-end QA strategy and execution for a cloud-native networking platform spanning UI, APIs, workflow orchestration, microservices, and real network devices.
- Must-haves: 8+ years in QA, with a focus on cloud-native applications and distributed systems/microservices, plus CCNP-level networking is a must. It also asks for REST/gRPC testing, pytest, Docker/Kubernetes, Linux, CI/CD, STP/STD/STR and TestRail.
- Watch out: The CCNP networking requirement is the likely blocker for an application-QA background.
- Link: https://builtin.com/job/qa-e2e-engineer/11181471

Tufin: QA Engineer, Performance / COST team (cybersecurity; the posting says mid level)
- Location / work model: Tel Aviv, hybrid.
- Posted: "Posted 8 days ago", so around 8 October.
- Role: Cross-team E2E and stability testing in environments that simulate real customers.
- Must-haves: 3+ year experience in E2E complex distributed client-server testing, scripting (Shell/Python), automation, strong Linux administration, firewall configuration (Palo Alto, Check Point and similar), SQL, and Docker/Kubernetes.
- Link: https://builtin.com/job/qa-performance-cost-team/11387230

2. Other current Tel Aviv roles (may be below your level)

- Senai: QA Engineer, a "QA Owner" role at a post-seed startup. Tel Aviv, posted 2026-10-08. You would own the whole QA process: regression suite, smoke tests and go/no-go decisions on releases. Experience with AI tools like Claude Code is a plus. Link: https://www.comeet.com/jobs/senai/CA.004/qa-engineer/19.374
- Hello Heart: QA Engineer. Tel Aviv, in-office according to Built In, posted 2026-09-22. Requires 4+ years of experience in Manual QA, iOS and Android testing, and E2E testing across mobile and backend. Link: https://job-boards.greenhouse.io/helloheart/jobs/8789178002
- Team8 / FlowRx: Senior Automation Engineer / RPA Specialist. Tel Aviv, posted 2026-10-12. This is RPA work (UiPath, Windows automation), not classic QA, so it only fits if you want to pivot. Link: https://www.comeet.com/jobs/team8/61.003/flowrx--senior-automation-engineer--rpa-specialist/D1.373
- Anchor: QA & Automation Engineer. Tel Aviv, in-office, fintech, posted about a month ago. Uses Cypress, Playwright, Claude Code and Cursor. Link: https://builtin.com/job/qa-automation-engineer/10948746

Dead lead: A search result listed a "Senior QA Engineer – Cyber & AI" opening at Dream in Tel Aviv. When I opened Dream's careers page, it showed no open positions, so treat it as closed.

3. Who is hiring senior QA now

Cybersecurity companies show up most often:
- Security / networking: Seemplicity, Tufin, DriveNets, and Atera (Web QA & Automation, Tel Aviv, listed 12 August).
- Storage / infrastructure (Herzliya): INFINIDAT has several automation tech-lead and test team-lead roles listed between June and July. They're older, so check they're still open.
- QA leadership (only if you'd consider moving up): NICE has a QA Director role in Ra'anana, hybrid. A General Motors "Senior QA Engineer" in Herzliya also appears in search results, but I couldn't open the page to confirm it's still open.
- Health and fintech startups: Hello Heart, Senai, FlowRx, Anchor.

I couldn't confirm any current openings at your former employers (Transmit Security, Checkmarx, Kaltura). Check their careers pages directly, since alumni referrals there are a strong route.

4. Salary ranges, senior QA in Tel Aviv

The sources disagree, and all are self-reported or modelled estimates.
- ERI SalaryExpert: a senior level qa engineer (8+ years of experience) earns an average salary of ₪ 233,790 a year, about ₪19.5K a month. Its overall range is between ILS 143,957 and ILS 250,431.
- Glassdoor, QA Automation in Tel Aviv: about ₪17K–27K a month for the 25th–75th percentile, with top earners have reported making up to ₪31,000 (90th percentile). Glassdoor's pages label these figures "per year", but its own range text says "/mo", so they are monthly.
- Glassdoor, QA Engineer (general): ₪12K-₪20K/mo.
- PayScale, all of Israel: A mid-career Quality Assurance (QA) Engineer with 5-9 years of experience earns an average total compensation of ₪216,000. That figure rests on only 7 salaries.

My estimate: a senior QA with strong automation skills is most likely to earn about ₪22K–30K gross a month in Tel Aviv high-tech. Manual-heavy roles sit lower, around ₪15K–20K. Leads and automation architects can go above ₪30K, and equity varies by company. This is an inference from the sources above, not a published figure. No posting I found listed a salary.

5. Most in-demand skills (from the postings I read)

1. Playwright, plus Python/pytest or TypeScript. Seemplicity requires it, and one Glassdoor snippet mentions Hands-on experience with automation frameworks such as Playwright.
2. AI-assisted testing. This now appears in almost every posting (Cursor, Copilot, Claude Code). DriveNets wants someone to direct AI agents for test generation and triage.
3. API testing (REST, GraphQL, gRPC), SQL, and CI/CD (GitHub Actions, Jenkins).
4. Docker/Kubernetes, Linux and cloud (AWS/Azure).
5. Formal test documents (STP/STD/STR) and owning test strategy. Israeli postings still treat these as must-haves, which plays well to 15 years of experience.
6. Cybersecurity domain experience. Several roles name it as preferred, which is a real advantage given Checkmarx and Transmit Security.

Confidence & gaps

- Coverage: LinkedIn, Glassdoor and AllJobs/Drushim don't show individual postings without logging in. Many senior Hebrew-language and agency postings are probably missing.

- Dates: Dates come from aggregator metadata (Gurify, Built In, Secret Tel Aviv), checked against the employers' own hiring systems where possible. The Seemplicity, Senai, Team8 and Hello Heart links go to the employer's own hiring page. The DriveNets, Tufin and Anchor links go to Built In, because I couldn't find the employer's own page for those.
- Salary: Low confidence. Glassdoor's labels are internally inconsistent, and PayScale's sample is tiny. Treat the ranges as rough guidance.
- Next steps: Run LinkedIn searches filtered to "past month" for "Senior QA" and "QA Automation" in Tel Aviv District. Also check the careers pages of Wiz, Cato Networks, Armis, Check Point, monday.com and CyberArk, which hire QA regularly.
